About this book

Dental caries has been called a "silent epidemic" and is the most prevalent chronic disease affecting children. Though much has been written on the science and practice of managing this disease, publications are diverse in their loci, preventing easy access to the reader. *Early Childhood Oral Health* coalesces all the important information related to this topic in a comprehensive reference for students, academics, and practitioners.

Soft drinks and dental health: A review of the current literature

J.F. Tahmassebi*, M.S. Duggal, G. Malik-Kotru, M.E.J. Curzon

Department of Paediatric Dentistry, Leeds Dental Institute, Clarendon Way, Leeds LS2 9LU, UK

Received 24 May 2004; received in revised form 25 October 2004; accepted 5 November 2004

KEYWORDS
Soft drinks;
Erosion;
Dental caries

Summary In recent years there has been increased interest in the role of commercial soft drinks in dental diseases namely as dental caries and erosion. The objective of this paper has been to review the past and current literature to determine the present knowledge on this subject. The literature related to dental caries, erosion, drinks, soft drinks and fruit juices was reviewed. The literature shows efforts have been taken to modify soft drinks by either adding or deleting certain components so as to reduce their harmful effects on teeth. A rational protocol to encourage the sensible use of drinks and the modification of drinks to render them less harmful would be advisable.
© 2004 Elsevier Ltd. All rights reserved.

Introduction

Soft drinks, excluding milk and water, have been suggested as causing damage to the teeth for two reasons. Firstly, the low pH and high titratable acidity of some drinks may lead to erosion of reference to the paediatric population. This paper reviews the background to the use of these drinks, findings and recommendations of the past studies and discusses the modification made accordingly to the composition of the soft drinks that are present on the market.

Music interventions for dental anxiety

J Bradt¹, A Teague¹

Affiliations + expand

PMID: 27886431 DOI: 10.1111/odi.12615

Abstract

Anxiety is a significant issue in the dental care of adults and children. Dental anxiety often leads to avoidance of dental care which may result in significant deterioration of oral and dental health. Non-pharmacological anxiety management interventions such as music listening are increasingly used in dental care. Although efficacy for music's anxiolytic effects has been established for pre-operative anxiety, findings regarding the use of music listening for dental anxiety are inconclusive, especially for children. The use of music for passive distraction may not be adequate for children and highly anxious

Abstract

Anxiety is a significant issue in the dental care of adults and children. Dental anxiety often leads to avoidance of dental care which may result in significant deterioration of oral and dental health. Non-pharmacological anxiety management interventions such as music listening are increasingly used in dental care. Although efficacy for music's anxiolytic effects has been established for pre-operative anxiety, findings regarding the use of music listening for dental anxiety are inconclusive, especially for children. The use of music for passive distraction may not be adequate for children and highly anxious patients. Music therapy interventions offered by a trained music therapist may be needed to have a significant impact. Music therapy interventions are individualized to the patient and geared at enhancing patients' active engagement in the dental visit. Interventions may include (i) active refocusing of attention,
